**AMENDMENTS TO THE CLAIMS** 

1. (Currently Amended) In an image communication apparatus for compressing video and

audio data of an image and transmitting them, a packet data transmission protocol, in which one

packet data frame comprises:

header data containing information for separating video data and audio data and for

synchronizing between a transmitter side and a receiver side;

transmission and reception data size information based on a communication speed that

varies based on the compression ratio of the video data;

compressed audio data and video data;

a control index representing information for indicating an additional operation from the

group consisting of an image quality selection, an image retransmission, a privacy mode and a

change in the size of video data and designation of conversion of image size data; and

control data for notifying the receiver side of data relating to the additional operation, for

representing information for requesting a compression ratio of the video data to be transmitted when

the control index is controlled to select the quality of the transmitted image, and for representing a

sequence number for requesting the image retransmission when the retransmission of the image data

is requested in the control index.

2-7. (Canceled)

8. (Previously Presented) The data transmission protocol according to claim 1, wherein

the control data represents information of a packet size of the image data when the control index

represents a change in the image data size.

Supplemental Reply to October 19, 2005 Office Action

9. (Previously Presented) The data transmission protocol according to claim 1, wherein

the privacy mode is an information for representing an inverse of video or audio data and a

reverse of video or audio data.

(Original) The data transmission protocol according to claim 9, wherein, in the 10.

privacy mode, the video or audio data is transmitted in the inverse or reverse state according to

the control data and the control index.

11. (Previously Presented) The data transmission protocol according to claim 1, wherein,

in the image data size, the sequence number and a Cyclic Redundancy Checking (CRC) code are

inserted for each different image data size based on a predetermined value according to the

change in the image data size indicated by the control index.

12. (Original) The data transmission protocol according to claim 11, wherein, when

the data size is less than 15 Kbytes, the sequence number and the CRC are inserted for every 64

bytes or 128 bytes.

(Original) The data transmission protocol according to claim 11, wherein, when 13.

the data size is more than 15 Kbytes, the sequence number and the CRC are inserted for every

256 bytes or 2048bytes.

14-19. (Canceled)
